Finding the Farm

About the Farm

Reduced milking times, improved cow management and hygiene are just some of the benefits father and son Gilmour and Kevin Lawrie have seen in the first four months since installing a GEA Farm Technologies 30/30 rapid exit parlour.

A new 120ft by 50ft building at Sandyford Farm, incorporates the new parlour, collecting yard, offices and viewing gallery.

Gilmour said: "We believe the GEA WestfaliaSurge equipment was the only choice for us because of the technology and reputation of the brand and dealership in this area."

Milk, which is sold at a premium to First Milk, has always been in the top bracket for cell counts and hygiene. However, in just four months the new parlour's IQ clusters have already made a difference.

"In the last four months we have only tubed two cows out of 227 milking for mastitis. Cell counts are running at 89 and bactoscans are down to 9 and I believe the cows are milking out better as well."

Another major benefit has been in reduced milking time saving 3/4 hour at each of the twice daily millings. The performance from the parlour is encouraging the Lawrie's to consider increasing the milking to three times a day this summer.
